Larvae of *Dermanyssus gallinae* in ovipositional capsule of *Dicrostonyx torquatus* (Aves, Tyrannidae). For the first time, the species *Dicrostonyx torquatus* (Streblidae) is recorded as a host of *Dermanyssus gallinae*. Fifteen specimens of this species were collected in two localities in the central-west of Brazil. Ticks, deposited in the stomach of the birds, were observed from April to October, with a peak in June.

EDMONTON – Mike Babcock is known for creating hockey mindsets and competitive environments that relentlessly push the limits. Since he has the perfect canvas right in front of him for a four-year project in Edmonton, Babcock’s imaginative approach has started taking on a much bigger area. He has stepped right on to the wreckage of the previous regime’s blueprint of ineptitude for the junior club, leaving a barren wasteland behind. “I’ve been on four different teams now in three different leagues, from the West Coast to the East Coast,” said the Team Canada head coach.

“I’ve seen a lot of good teams and a lot of bad teams. I think everyone likes to write a book about the good teams, but unfortunately the reality is, they’re all bad in one way or another. “Edmonton is a good club; they’re proud of their team and they’ve got a lot of enthusiasm. They have been lacking of course in the last five years, but they’ve been trying to change that. And they’ve changed it. It’s good to see.” After years of loading up on big-bodied bodies, the Oilers suddenly have a surplus of speed and skill. They are stockpiling skill up and down the lineup, with some good prospects playing as well as their NHL equivalents. “There’s been a real big evolution in the team,” Babcock said. “I think it really starts with their management. The decision to bring in the new GM, Paul McKeown, (who traded Craig Button for Milan Lucic) was a real good call. They were very insistent in saying that they wanted

Those who do not believe in climate change are the biggest climate deniers there can be. Perhaps they're just scared for their grandchildren. And who can blame them? We're fighting over glaciers, raising sea level and the level of the oceans, mass extinctions, raging wildfires, while they're focused on their retirement. My dad died at age 78. I'm not thrilled about the coming climate catastrophe, but I can't say I'm totally frightened. If I were, I'd probably have permanently moved by now. Meanwhile, even though the climate deniers are still saying "no" to the rise in sea level, we've been adding to the ice sheets and glaciers at an ever-increasing rate. In fact, when you add up all the existing ice, the amount of ice there is today is still actually much greater than it was 60 years ago. And when a truly terrible event happens in the next year or two, I don't think a single person will be in any position to say "Why should I be worried? The climate is stable now." Don't forget about Sandy, about the many other hurricanes and storms that are going to batter the planet in the next decade. And forget about the climate deniers. We're done with them. They're history. Mark Hertsgaard is the executive director of the Nation Institute. He can be reached at mark@nationinstitute.org. Polar fractionation and thermal transformation of inorganic carbon within soils. The processes of particle-particle and particle-liquid association are identified as central to soil carbon (C) dynamics. In this work, we present the effects of particle fractionation and thermal treatment on the quantity and species of C in soil aggregates. Four soil samples from the long-term field experiment at Arches National Park (AZ, USA) were fractionated using a density-gradient procedure, and examined using a combination of thermal treatment and Raman spectroscopy. Density fractionation distinguishes the solid from liquid carbon pools in the soil, and the rate of the f678ea9f9e
